ENHANCED**

Temperature-resistant base materials with low z-axis expansion

IS400, IS420 and PCL370HR

The demands relating to the reliability of printed circuit boards are increasing. Major influences besides the actual layout and design are the thermal attributes of the base materials such as the glass transition temperature T_g , time to delamination at 260 °C (T_{260}) and 288 °C (T_{288}), thermal decomposition temperature (T_D) and the thermal expansion behaviour in the z-axis. In many cases the reliability of printed circuit boards is determined by destructive tests, especially in automobile applications.

Typical terms are:
-40 °C up to +125 °C/> 500 cycles or
-40 °C up to +140 °C/≥ 1.000 cycles.

It has been demonstrated that only base materials with a low expansion in the z-axis are able to pass these tests.

The base material qualities IS400, IS420 and PCL370HR comply with these requirements without restrictions.

For predictable reliability of printed circuit boards these materials offer excellent performance in order to prevent barrel cracks, corner cracks, resin recession and other failure mechanisms.

Typical Applications

- High layer count multilayers
- Industrial electronics
- Automobile electronics
- Fine-line structures
- High temperature electronics

IS400 – Special properties

- High thermal resistance:
 T_g approx. 150 °C
 $T_{260} > 60$ min
 $T_{288} > 5$ min
 T_D approx. 330 °C
- Low z-axis expansion
 $\alpha_z = 40-45$ ppm/K @ RT-120 °C
- TCT > 1.000 cycles/-40 °C up to +140 °C
- Low absorption of water
- Smooth surface
- Dimensionally stable
- CAF-enhanced

Raw materials

The same types of E-glass-fabric are used as for all our base materials.

Typical copper foil thicknesses (18, 35, 70 µm) correspond to IPC-4562, grade 3 (HTE-quality). For laminates with a substrate ≤ 0.1 mm VLP foils with HTE properties are used.

Laminates are only available with double sided copper cladding.

Supply forms and storage

The laminates are produced in standard sheet size: 1225 x 1070 mm warp.

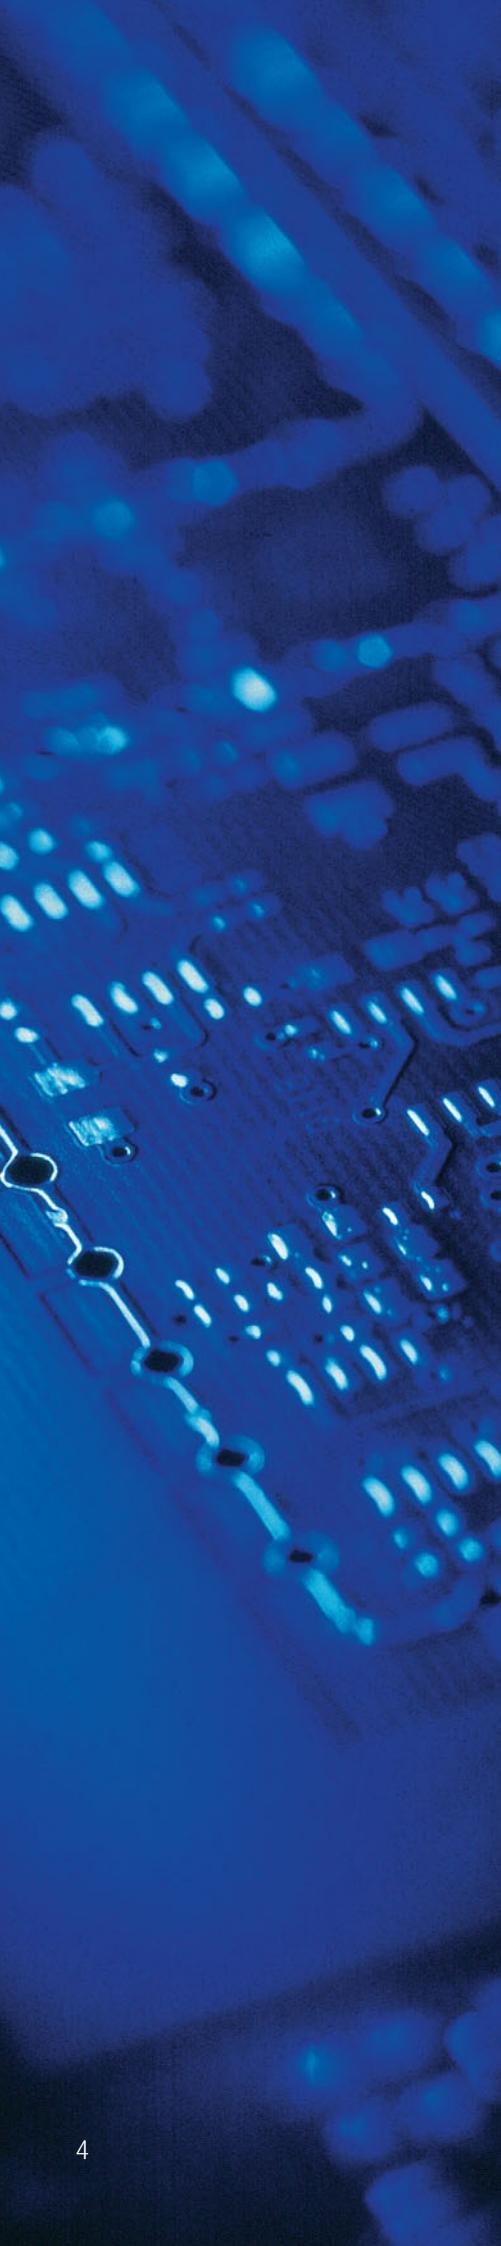

Prepregs are available with a standard roll width of approx. 1250 mm (location oriented).

Laminate and prepreg panels are cut to specification.

For pin-lam technology, tooling holes are punched in the prepreg panels as specified. A variety of punch tools are available for this purpose.

The prepregs can be stored for six months at < 5 °C or for three months at < 20 °C and relative humidity of < 50 %. When removing chilled product from storage, take appropriate steps to prevent condensation.

Current product information can also be obtained from our website www.isola-group.com

PCL370HR – Special properties

- High thermal resistance:
 T_g approx. 170 °C
 $T_{260} > 60$ min
 $T_{288} > 10$ min
 T_D approx. 340 °C
- Low z-axis expansion
 $\alpha_z = 35-40$ ppm/K @ RT-120 °C
- TCT > 1.000 cycles/-40 °C up to +140 °C
- Low absorption of water
- Smooth surface
- Dimensionally stable
- CAF-enhanced

Processing Recommendations

IS420 and PCL370HR should be pressed for 120 minutes at 190 °C and IS400 for 70 minutes at 180 – 185 °C to assure a complete curing of the resin matrix. A post baking of the laminates is not required. We recommend to use copper foil of the type HTG for the multilayer production.

As with all filled base materials adapted drill parameters are essential.

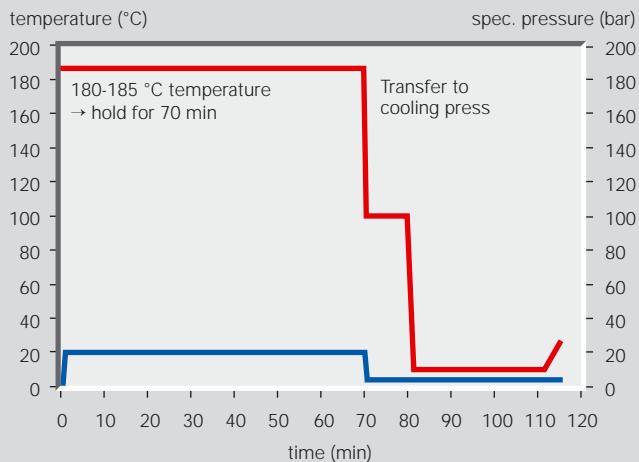

Cross Sections

Hole diameter 0.35 mm after 3x reflow, 1.000 thermal cycles -40/+140 °C.
